

How to gain Picture Perfect Art Lighting from your old existing picture lights

Old picture lights have a bad reputation, but this can now be quickly & easily changed to gain great results. LED Upgrade Kits are available, offering the latest LED technology, to remove all the negative issues associated with halogen light sources.

Lighting glare, damaging heat and UV can be removed to give an increased and uniform canvas coverage. These new kits will bring out the rich colours and increase the definition across the whole painting. Running costs can be reduced by up to 93% with no maintenance required for over 10 years. It all makes sense, but be careful, not all LED Upgrades are the same. Here are the key things you must insist on:

COLOUR TEMPERATURE

A warm white colour, ideally 2700K.

COLOUR RENDERING INDEX (CRI)

Gain the highest level possible. From 0 (darkness) – 100 (sunlight). Many LEDs are as low as 80. Do not accept anything less than 95. The higher the CRI, the truer the colours viewed will be. This will also add to the depth & definition & bring out some hidden gems in your paintings.

LED LENSING & SPACING

A good spacing between LEDs is 6". The LEDs must be lensed to gain the high coverage across the whole canvas, especially further down.

ARM LENGTH

The existing arm can cause many issues & replacing it with a correctly sized one with a swivel knuckle will overcome these. The light source should be screened from view, with only the light coverage on the painting visible.

LIGHTING LEVELS

A separate dimmer will be required for each painting to ensure correct light levels are achieved.

EXISTING HEAD SIZE

From small to large, modular upgrade kits are available for easy installation, allowing great coverage for all size variations.

UPGRADING YOUR PICTURE LIGHTS

When done correctly, this process will be quick & easy and will enhance your viewing pleasure immediately. ■
